

Detection pipeline & feature roadmap

The current system with the network admin's proposals, colour-coded by the **build / integrate / defer** verdict from the cited feature-evaluation study. “Regae” is identified as a **RADIUS / AAA server** (~75% confidence, pending the admin).

Current

— built & running

Build next

— custom, recommended

Integrate

— existing tool as data source

Defer

— future work

Recommended build order

1

Concurrent-session detection

→

2

AI assistant

→

3

Wazuh software-inventory ingest

→

4

RADIUS accounting feed

· defer PacketFence & LibreNMS to future work

Concurrent-session detection

BUILD

Closes the **identity** gap. Reuses JWT auth + audit log + per-request IP/MAC — flag one user across N hosts in a window. Highest value / lowest effort.

AI Assistant

BUILD

LLM over the detections DB: triage, plain-English queries, explanations, remediation. Read-only, actions audited. Strongest **novelty** lever.

Wazuh

INTEGRATE

Syscollector inventories installed software and flags unsanctioned apps (demo flags TeamViewer & ChatGPT). Ingest its alerts as a **software** source.

RADIUS / AAA — “Regae?”

INTEGRATE

Best fit (~75%): FreeRADIUS **Simultaneous-Use** enforces concurrent-login limits; accounting feeds the identity signal. Confirm spelling with the admin.

PacketFence

DEFER

NAC enforcement for rogue **hardware** (802.1X, quarantine). Too heavy for final-year scope — cite as future work.

LibreNMS

DEFER

SNMP monitoring / inventory — overlaps existing discovery and targets availability, not unauthorised use. Lowest priority.

Basis: build/integrate/defer verdicts from a cited comparative technology assessment (2026-07-24) mapping each feature to a Shadow-IT surface — software (Wazuh), hardware (PacketFence), identity (concurrent-session + RADIUS), workflow (AI assistant). **Novelty guard:** the two custom builds strengthen the contribution; the platforms stay data sources / future work.
